## Exam 3, Fall 2004

Notes on Solution

## Question 1

r:
5\%

Cost of research project:

| period | amount | PV |
| :---: | :---: | ---: |
| 0 | 0 | 0.00 |
| 1 | 60 | 57.14 |
| 2 | 60 | 54.42 |
| 3 | 60 | 51.83 |
| 4 | 60 | 49.36 |
| 5 | 60 | 47.01 |
|  |  |  |
|  | total PV | 259.77 |

Value of design, low demand

| 6 | 10.00 | low value in each year from 6 onward |
| :---: | ---: | :--- |
| 5 | 200.00 | PV of stream in year 5 |
| 0 | 156.71 | PV of stream in year 0 |
| net PV, low | -103.06 |  |
| Value of design, high demand |  |  |
| 6 | 20.00 | high value in each year from 6 onward |
| 5 | 400.00 | PV of stream in year 5 |
| 0 | 313.41 | PV of stream in year 0 |
| net PV, high | 53.64 |  |

Computing the expected value:

| case | prob | net PV |
| :---: | ---: | :--- |
| low | 0.40 | -41.23 |
| high | 0.60 | 32.19 |
| Expected NPV: | -9.04 | Expected net PV is negative: bad idea to carry out the <br> project. |

Question 2

$$
Q=K^{\wedge}(1 / 4)^{*} L^{\wedge}(3 / 4)
$$

| K | L | Q | TC | AC |
| :---: | :---: | :---: | :---: | :---: |
| 10 | 204.03 | 96 | 772.09 | 8.04 |
| 11 | 197.65 | 96 | 768.95 | 8.01 |
| 12 | 192.00 | 96 | 768.00 | 8.00 |
| 13 | 186.95 | 96 | 768.84 | 8.01 |
| 14 | 182.38 | 96 | 771.15 | 8.03 |
| 15 | 178.24 | 96 | 774.71 | 8.07 |
| 16 | 174.44 | 96 | 779.33 | 8.12 |
| 17 | 170.95 | 96 | 784.86 | 8.18 |
| 18 | 167.73 | 96 | 791.18 | 8.24 |
| 19 | 164.73 | 96 | 798.20 | 8.31 |
| 20 | 161.94 | 96 | 805.82 | 8.39 |
|  |  |  | $\begin{aligned} & \stackrel{\rightharpoonup}{x} \\ & \frac{{ }_{n}^{a}}{+} \\ & + \\ & \stackrel{y}{x} \\ & \frac{1}{a} \\ & \text { II } \\ & \hline \end{aligned}$ | $\begin{aligned} & \frac{0}{0} \\ & 1 \\ & \text { II } \\ & 0 \\ & 0 \end{aligned}$ |

The firm should use 12 units of capital and 192 units of labor. Its average cost will be $\$ 8.00$ per unit of output.

## Question 3

$T C=F+G^{*} Q$
$P=A-B^{*} Q$

|  |
| ---: | ---: |

| Q | P | TC | TR | AC | AR | AR-AC |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 45 | 550 | 23500 | 24750 | 522.22 | 550 | 27.78 |
| 46 | 540 | 23800 | 24840 | 517.39 | 540 | 22.61 |
| 47 | 530 | 24100 | 24910 | 512.77 | 530 | 17.23 |
| 48 | 520 | 24400 | 24960 | 508.33 | 520 | 11.67 |
| 49 | 510 | 24700 | 24990 | 504.08 | 510 | 5.92 |
| 50 | 500 | 25000 | 25000 | 500.00 | 500 | 0.00 |
| 51 | 490 | 25300 | 24990 | 496.08 | 490 | -6.08 |
| 52 | 480 | 25600 | 24960 | 492.31 | 480 | -12.31 |
| 53 | 470 | 25900 | 24910 | 488.68 | 470 | -18.68 |
| 54 | 460 | 26200 | 24840 | 485.19 | 460 | -25.19 |
| 55 | 450 | 26500 | 24750 | 481.82 | 450 | -31.82 |
|  | $\begin{aligned} & 0 \\ & \stackrel{\circ}{1} \\ & \vdots \\ & \hline 8 \\ & \hline- \\ & \hline 1 \\ & 0 \end{aligned}$ | 0 <br> 0 <br> 0 <br> 0 <br> 0 <br> 0 <br> 0 <br> 1 <br> 1 <br> 0 | $\begin{aligned} & \text { o } \\ & \stackrel{1}{11} \\ & \text { "11 } \\ & \stackrel{\sim}{\mid} \end{aligned}$ | $\begin{aligned} & \text { O} \\ & \hline \\ & \vdash \\ & \text { II } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { Q } \\ & \text { "11 } \\ & \frac{\underline{r}}{4} \end{aligned}$ |  |

The organization should charge $\$ 500$ and enroll 50 students. Its revenue will just cover its costs.

## Question 4

Part (a)

$$
P=A-B^{*} Q
$$

A:
B:

| 6000 |
| ---: |
| 100 |

| Q | P | TC | TR | MR |
| :---: | :---: | :---: | :---: | :---: |
| 25 | 3500 |  | 87500 |  |
| 26 | 3400 |  | 88400 | 900 |
| 27 | 3300 |  | 89100 | 700 |
| 28 | 3200 |  | 89600 | 500 |
| 29 | 3100 |  | 89900 | 300 |
| 30 | 3000 |  | 90000 | 100 |
| 31 | 2900 |  | 89900 | -100 |
| 32 | 2800 |  | 89600 | -300 |
| 33 | 2700 |  | 89100 | -500 |
| 34 | 2600 |  | 88400 | -700 |
| 35 | 2500 |  | 87500 | -900 |
|  | 0 <br> 0 <br> 0 <br> 1 <br> 0 <br> 0 <br> 0 <br> 11 <br> 0 | $\begin{aligned} & 0 \\ & \text { ॥ } \\ & 0 \\ & \hline \end{aligned}$ |  |  |

The firm should charge $\$ 3000$ for the test and produce 30 units. It has no costs so its total revenue of $\$ 90,000$ will be profit.

Part (b)
First task is to compute the PV of the 20 year stream of monopoly profits:
PV forever
$\begin{aligned} 1,800,000 & =90,000 / 0.05 \\ 678,401 & =1,800,000 /(1.05)^{\wedge} 20 \\ 1,121,599 & =1,800,000-459,169\end{aligned}$
Payments after 20
Value through 20
Next task is compute the CS during the patent period (years 1-20):
CS during patent:

$$
\begin{aligned}
45,000 & =(1 / 2)^{*}(6000-3000)^{*} 30 \\
900,000 & =45,000 / 0.05 \\
339,201 & =900,000 /(1.05)^{\wedge} 20 \\
560,799 & =900,000-339,201
\end{aligned}
$$

CS if forever
CS after 20

After the patent period, the test is available for free. Q increases until W2P (and hence $P$ ) is driven to zero: $0=6000-100^{*} \mathrm{Q}$. Therefore, $\mathrm{Q}=60$ after the patent expires:

CS after patent
CS of $\$ 180,000$ forever
Post-patent CS
$180,000=(1 / 2)^{*} 6000 * 60$
$3,600,000=180,000 / 0.05$
$1,356,802=3,600,000 /(1.05)^{\wedge} 20$

Final step is to add the CS values together. The total CS is the PV of the CS during the patent period plus the PV of the CS after the patent expires:

Total CS: $\quad 1,917,602=560,799+1,356,802$
Part (c)

The payoff if the trial succeeds is the PV of profit from above less the cost of the test. If the trial fails, the payoff is the cost of the test.

A risk-neutral firm would NOT proceed with the trial because the EV is negative. On average, the firm would expect to lose about $\$ 159 \mathrm{~K}$.

Part (d)
The firm only looks at profit (PS) when making its decision and ignores the CS the test would generate. For efficiency, we would need to consider BOTH PS and CS:

| Outcome | Prob | PS Payoff | CS Payoff | Tot Payoff | Prob*Payoff |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: |
| Trial Succeeds | $75 \%$ | 121,599 | $1,917,602$ | $2,039,201$ | $1,529,400$ |  |  |  |
| Trial Fails | $25 \%$ | $-1,000,000$ | 0 | $-1,000,000$ | $-250,000$ |  |  |  |
| Expected SS: |  |  |  |  |  |  |  | $1,279,400$ |

From the standpoint of efficiency, the trial SHOULD be conducted: the expected SS is positive. The firm's decision is inefficient: patients gain enough in expected CS to be able to compensate the firm for conducting the trial and still come out ahead. One possible financial arrangement would be for the government to pay for part or all of the cost of the trial. As long as it pays enough for the EV of the profit decision to be positive, the firm will proceed with the trial.
