## Exam 3, Fall 2006

## Notes on Solution

## Question 1

Part (a)

The foundation's decision tree looks as follows (gross payoffs):

The EV of the research project is $0.1^{*}(400 \mathrm{M})+0.9^{*}(0)=40 \mathrm{M}$. Since that's lower than the alternative, the foundation should give the money out in grants.

Part (b)

The first part of the foundation's decision tree looks as follows:

The probability of ending up at points A-D are listed below:

| Point | Research | Fed Prob | Pilot | Prob | Overall |
| :---: | :---: | :---: | :---: | :---: | :---: |
| A | Success | $10.0 \%$ | Likely | $70.0 \%$ | $7.0 \%$ |
|  |  |  | Unlikely | $30.0 \%$ | $3.0 \%$ |
| B |  | Failure | $90.0 \%$ | Likely | $50.0 \%$ |
|  |  |  |  | $50.0 \%$ | $45.0 \%$ |

The overall chances of outcome from the pilot study:
Likely

$$
7 \%+45 \%=52 \%
$$

Unlikely

$$
3 \%+45 \%=48 \%
$$

Depending on the outcome from the pilot study, the conditional probabilities of the research project succeeding or failing are:

| Pilot | Research | Conditional Probability |
| :---: | :---: | :---: |
| Likely | Success | $7 \% / 52 \%=13.46 \%$ |
|  | Failure | $45 \% / 52 \%=86.54 \%$ |
| Unlikely | Success | $3 \% / 48 \%=6.25 \%$ |
|  | Failure | $45 \% / 48 \%=93.75 \%$ |

The decision trees branching off from each of the dotted ellipses above are as shown:

Likely

Unlikely

The EV of proceeding with the research project when the pilot indicates that it is likely to succeed is $0.1346^{*}(395 M)+0.8654^{*}(-5 M)=49 M$. Since that's higher than 45 M , if the pilot indicates the project is likely to succeed, the foundation should proceed with the research.

The EV of proceeding with the the research project when the pilot indicates that is is unlikely to succeed is $0.0625^{*}(395 \mathrm{M})+0.9375^{*}(-5 \mathrm{M})=20 \mathrm{M}$. Since that's lower than 45 M , if the foundation should not do the research project if the pilot indicates "unlikely".

Finally, taking these outcomes into account, the expected value of the pilot can be calculated:

Even without computing the EV, it's clear that the foundation is better off giving the money out as grants: the payoff is higher than either of the expected payoffs associated with the pilot. Computing the EV just for completeness: $E V=0.52^{*}(49 \mathrm{M})+0.48^{*}(45 \mathrm{M})=47 \mathrm{M}$.

## Question 2

$$
Q=K^{\wedge}(0.4)^{*} L^{\wedge}(0.6)
$$

| Q | 20 |
| ---: | ---: |
| Pk | 15 |
| PI | 25 |
|  |  |

|  | K | L | Q | TC | AC |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 15 | 24.23 | 20 | 830.71 | 41.54 |
|  | 16 | 23.21 | 20 | 820.20 | 41.01 |
|  | 17 | 22.29 | 20 | 812.22 | 40.61 |
|  | 18 | 21.46 | 20 | 806.38 | 40.32 |
|  | 19 | 20.70 | 20 | 802.39 | 40.12 |
|  | 20 | 20.00 | 20 | 800.00 | 40.00 |
|  | 21 | 19.36 | 20 | 799.00 | 39.95 |
|  | 22 | 18.77 | 20 | 799.22 | 39.96 |
|  | 23 | 18.22 | 20 | 800.52 | 40.03 |
|  | 24 | 17.71 | 20 | 802.77 | 40.14 |
|  | 25 | 17.24 | 20 | 805.89 | 40.29 |
|  |  |  |  |  | $\begin{aligned} & 0 \\ & \substack{0 \\ 1 \\ 1 \prime \\ 0 \\ \hline \\ \hline} \end{aligned}$ |

The firm should use 21 units of capital and 19.36 units of labor. Its average cost will be $\$ 39.95$ per unit of output.

## Question 3

$$
\begin{aligned}
& \mathrm{TC}=\mathrm{F}+\mathrm{G}^{*} \mathrm{Q} \\
& \mathrm{P}=\mathrm{A}-\mathrm{B}^{*} \mathrm{Q}
\end{aligned}
$$

| Q | P | TC | TR | Profit | MC | MR |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 15 | 300 | 1490 | 4500 | 3010 | na | na |
| 16 | 290 | 1500 | 4640 | 3140 | 10.00 | 140 |
| 17 | 280 | 1510 | 4760 | 3250 | 10.00 | 120 |
| 18 | 270 | 1520 | 4860 | 3340 | 10.00 | 100 |
| 19 | 260 | 1530 | 4940 | 3410 | 10.00 | 80 |
| 20 | 250 | 1540 | 5000 | 3460 | 10.00 | 60 |
| 21 | 240 | 1550 | 5040 | 3490 | 10.00 | 40 |
| 22 | 230 | 1560 | 5060 | 3500 | 10.00 | 20 |
| 23 | 220 | 1570 | 5060 | 3490 | 10.00 | 0 |
| 24 | 210 | 1580 | 5040 | 3460 | 10.00 | -20 |
| 25 | 200 | 1590 | 5000 | 3410 | 10.00 | -40 |
|  | $\begin{aligned} & 0 \\ & \stackrel{0}{0} \\ & 1 \\ & \dot{0} \\ & \stackrel{0}{1} \\ & 11 \\ & 0 \end{aligned}$ |  |  |  | $\begin{aligned} & 0 \\ & \frac{1}{0} \\ & \vdots \\ & \hline \\ & 11 \\ & 0 \\ & \sum \end{aligned}$ |  |

The organization should charge $\$ 230$ and produce 22 tours. It will earn $\$ 3500$ in profits.

## Question 4

Part (a)
If the project succeeds, each year the firm will produce 5 million units and sell them for $P=30-5=25$.
Total revenue will be $\$ 25 * 5$ million $=\$ 125$ million. Total costs will be $\$ 20 * 5$ million $=\$ 100$ million. Each year's profits, therefore, will be $\$ 25$ million. The cash stream of cash flows would be:

Computing the PV:
Interest rate:
PV of an infinite stream:
500
PV of an infinite stream starting at 6:
PV of an infinite stream starting at 26:
$391.76=500 /(1+\mathrm{r})^{\wedge} 5$
$147.65=500 /(1+r)^{\wedge} 25$
PV of stream from 6-25:
$244.11=391.76-147.65$

The decision tree for the project is thus:

The $E V=0.3^{*}(144 \mathrm{M})+0.7^{*}(-100 \mathrm{M})=-27 \mathrm{M}$. A risk neutral firm would not undertake it: on average, it would expect to lose 27 M .

Part (b)
Next task is compute the CS during the patent period (years 6-25):

| CS during patent: | $12.5=(1 / 2)^{*}(30-25)^{*} 5$ |
| :--- | :--- |
| CS if forever | $250=12.5 / \mathrm{r}$ |
| CS from 6 to 25 viewed at year 5 | $156=250-250 /(1+\mathrm{r})^{\wedge} 20$ |
| CS from 6 to 25 viewed at year 0 | 122 |

After the patent period, competition in the market will drive the price down to $\$ 20$. We can find $Q$ via the demand curve: $20=30-\mathrm{Q}$, so $\mathrm{Q}=10$ million.

| Q | 10 | $=(30-20) / 1$ |
| :--- | ---: | :--- |
| CS after patent | 50 | $=(1 / 2)^{\star}(30-20)^{\star} 10$ |
| CS if forever | 1,000 | $=50 / r$ |
| Post-patent CS | 295 | $=1000 /(1+r)^{\wedge} 25$ |

Final step is to add the CS values together. The total CS is the PV of the CS during the patent period plus the PV of the CS after the patent expires:

Total CS: $417=122+295$

Finally, calculating the EV of the CS:
Probability of success: 30\%
EV of CS $125=0.3^{*}(417)+0.7^{*}(0)$

The subsidy increases both private payoffs by $\$ 40$ million. Hence the firm's problem becomes the following:

| Outcome | Prob | Orig Payoff | New Payoff | Prob*New |  |  |
| :--- | ---: | ---: | ---: | ---: | :---: | :---: |
| Succeeds | $30 \%$ | 144 | 184 | 55 |  |  |
| Fails | $70 \%$ | -100 | -60 | -42 |  |  |
| Expected Profit: |  |  |  |  |  | 13 |

The EV is now positive, so the firm will undertake the project.
The CV cost of the $\$ 40$ million is $\$ 40 * 1.5=\$ 60$ million. Taking this into account the expected net benefit to the public (CS less CV) will be:

| Outcome | Prob | CS Payoff | CV cost | Net | Prob*Net |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Succeeds | $30 \%$ | 417 | 60 | 357 | 107 |
| Fails | $70 \%$ | 0 | 60 | -60 | -42 |

Since the EV of the project (including the full CV cost of the revenue needed to underwrite it) is positive, a risk-neutral government would proceed with the subsidy. The overall social surplus, including the returns to the firm, will be $65 \mathrm{M}+13 \mathrm{M}=78 \mathrm{M}$.
