

# Deriving Demand Equations

Key application of the model of choice

Example: popcorn and movies

Preferences:

$$\frac{Q_p}{Q_m} = \frac{2}{1}$$

$$Q_p = 2Q_m$$

Budget constraint:

$$P_p Q_p + P_m Q_m = M$$

Now leave *prices* and *M* as **variables**

Substituting in the preference equation:

$$P_p \mathbf{Q_p} + P_m Q_m = M$$

$$P_p (\mathbf{2Q_m}) + P_m Q_m = M$$

$$2P_p \mathbf{Q_m} + P_m \mathbf{Q_m} = M$$

Factoring out  $Q_m$ :

$$(2P_p + P_m) \mathbf{Q_m} = M$$

Solving for  $Q_m$  gives the **demand equation for movies**:

$$Q_m = \frac{M}{2P_p + P_m}$$

**Q** as a function of **M** and **prices**:  $Q_m(M, P_p, P_m)$

Also know:

$$Q_p = 2Q_m$$

Substituting for  $Q_m$  gives **popcorn demand**:

$$Q_p = 2Q_m = 2 \left( \frac{M}{2P_p + P_m} \right)$$

$$Q_p = \frac{2M}{2P_p + P_m}$$

**Q** as a function of **M** and **prices**:  $Q_p(M, P_p, P_m)$

Collecting the demands:

$$Q_m = \frac{M}{2P_p + P_m} \quad Q_p = \frac{2M}{2P_p + P_m}$$

Can plot  $Q_m$  as a function of  $P_m$  for given  $M, P_p$ :

### Case 1

$$M = \$28$$

$$P_p = \$3$$

$$Q_m = \frac{\$28}{2 * \$3 + P_m}$$

$$\text{Intercept: } Q_m = 4\frac{2}{3}$$

### Case 2

$$M = \$28$$

$$P_p = \$1$$

$$Q_m = \frac{\$28}{2 * \$1 + P_m}$$

$$\text{Intercept: } Q_m = 9\frac{1}{3}$$
